To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.

   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.

   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.

   "Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

MOS INTEGRATED CIRCUIT

Phase-out/Discontinued

μPD78P018FY

8-BIT SINGLE-CHIP MICROCONTROLLER

DESCRIPTION

The μPD78P018FY is a member of the μPD78018FY Subseries of 78K/0 Series products. The internal mask ROM of the μPD78018FY is replaced with one-time PROM or EPROM.

Because the μPD78P018FY can be programmed by users, it is ideally suited for applications involving the evaluation of systems in development stages, small-scale production of many different products, and rapid development and time-to-market of new products.

Caution The μPD78P018FYDW and 78P018FYKK-S are not guaranteed to maintain the reliability level required for mass production of the customer's devices. Please use only experimentally or for evaluation purposes during trial manufacture.

Detailed function descriptions are provided in the following user's manuals. Be sure to read them before designing.

μPD78018F, 78018FY Subseries User's Manual: U10659E

78K/0 Series User's Manual – Instructions: U12326E

FEATURES

- Pin compatible with mask ROM version (except V_{PP} pin)
- Internal PROM: 60 Kbytes **Note 1**
  μPD78P018FYDW, 78P018FYKK-S: Re-programmable (suited for system evaluation)
  μPD78P018FYCW, 78P018FYGC-AB8: Programmable only once (suited for small-scale production)
- Internal high-speed RAM: 1024 bytes **Note 1**
- Internal expansion RAM: 1024 bytes **Note 2**
- Internal buffer RAM: 32 bytes
- Supports the I^2C bus interface
- Operable over same supply voltage range as mask ROM version: V_{DD} = 1.8 to 5.5 V (except an A/D converter)
- QTOP™ microcontroller supported

Notes 1. The capacities of internal PROM and internal high-speed RAM can be changed by means of the internal memory size switching register (IMS).

2. The capacity of the internal expansion RAM can be changed by means of the internal expansion RAM size switching register (IXS).

Remarks 1. QTOP Microcontroller is a general term for microcontrollers which incorporate one-time PROM and are totally supported by NEC's programming service (from programming to marking, screening, and verification).

2. For the differences between the PROM version and mask ROM versions, refer to **1. DIFFERENCES BETWEEN THE μPD78P018FY AND MASK ROM VERSIONS**.

In this document, the term PROM is used in parts common to one-time PROM versions and EPROM versions.

1. DIFFERENCES BETWEEN THE μPD78P018FY AND MASK ROM VERSIONS

The μPD78P018FY is a single-chip microcontroller with an on-chip one-time PROM or EPROM that has program write, erase, and rewrite capability.

It is possible to make all the functions except for PROM specification and mask option of P60 to P63 pins, the same as those of mask ROM versions (μPD78011FY, 78012FY, 78013FY, 78014FY, 78015FY, 78016FY, and 78018FY) by setting the internal memory size switching register (IMS) and the internal expansion RAM size switching register (IXS).

Differences between the μPD78P018FY and mask ROM versions are shown in Table 1-1.

Table 1-1. Differences Between μPD78P018FY and Mask ROM Version

Item	μPD78P018FY	Mask ROM Versions
Internal ROM type	One-time PROM or EPROM	Mask ROM
Internal ROM capacity	60 Kbytes	μPD78011FY: 8 Kbytes μPD78012FY: 16 Kbytes μPD78013FY: 24 Kbytes μPD78014FY: 32 Kbytes μPD78015FY: 40 Kbytes μPD78016FY: 48 Kbytes μPD78018FY: 60 Kbytes
Internal high-speed RAM capacity	1024 bytes	μPD78011FY: 512 bytes μPD78012FY: 512 bytes μPD78013FY: 1024 bytes μPD78014FY: 1024 bytes μPD78015FY: 1024 bytes μPD78016FY: 1024 bytes μPD78018FY: 1024 bytes
Internal expansion RAM capacity	1024 byte	μPD78011FY: No μPD78012FY: No μPD78013FY: No μPD78014FY: No μPD78015FY: 512 bytes μPD78016FY: 512 bytes μPD78018FY: 1024 bytes
Internal ROM, internal high-speed RAM capacity changeable with internal memory size switching register (IMS)	Yes Note 1	No
Internal expansion RAM capacity changeable with internal expansion RAM size switching register (IXS)	Yes Note 2	No
IC pin	No	Yes
V_{PP} pin	Yes	No
On-chip pull-up resistor mask option of P60 to P63 pins	No	Yes
Electrical specifications Recommended soldering conditions	See respective data sheet of individual products.	

Notes 1. The internal PROM capacity becomes 60 Kbytes and the internal high-speed RAM capacity becomes 1024 bytes by the $\overline{\text{RESET}}$ input.

2. The internal expansion RAM capacity becomes 1024 bytes by the $\overline{\text{RESET}}$ input.

Caution There are differences in noise immunity and noise radiation between the PROM and mask ROM versions. When pre-producing an application set with the PROM version and then mass-producing it with the mask ROM version, be sure to conduct sufficient evaluations for the commercial samples (not engineering samples) of the mask ROM version.

2. PIN FUNCTIONS

2.1 Pins During Normal Operating Mode

(1) Port Pins (1/2)

Pin Name	I/O	Function		After Reset	Alternate Function
P00	Input	Port 0 5-bit input/ output port	Input only	Input	INTP0/TI0
P01	Input/ output		Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by means of software.	Input	INTP1
P02					INTP2
P03					INTP3
P04 Note1	Input		Input only	Input	XT1
P10 to P17	Input/ output	Port 1 8-bit input/output port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by means of software. Note 2		Input	ANI0 to ANI7
P20	Input/ output	Port 2 8-bit input/output port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by means of software.		Input	SI1
P21					SO1
P22					$\overline{\text{SCK1}}$
P23					STB
P24					BUSY
P25					SI0/SB0/SDA0
P26					SO0/SB1/SDA1
P27					$\overline{\text{SCK0}}$/SCL
P30	Input/ output	Port 3 8-bit input/output port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by means of software.		Input	TO0
P31					TO1
P32					TO2
P33					TI1
P34					TI2
P35					PCL
P36					BUZ
P37					—
P40 to P47	Input/ output	Port 4 8-bit input/output port. Input/output can be specified in 8-bit units. When used as an input port, an on-chip pull-up resistor can be specified by means of software. Test input flag (KRIF) is set to 1 by falling edge detection.		Input	AD0 to AD7

Notes 1. When using the P04/XT1 pin as an input port, set bit 6 (FRC) of the processor clock control register (PCC) to 1 (Do not use the on-chip feedback resistor of the subsystem clock oscillator).

2. When using the P10/ANI0 to P17/ANI7 pins as the A/D converter analog input pins, set port 1 to the input mode. At this time, on-chip pull-up resistors are automatically disconnected.

(1) Port Pins (2/2)

Pin Name	I/O	Function		After Reset	Alternate Function
P50 to P57	Input/output	Port 5 8-bit input/output port. LEDs can be driven directly. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by means of software.		Input	A8 to A15
P60	Input/output	Port 6 8-bit input/output port. Input/output can be specified in 1-bit units.	N-ch open-drain input/output port. LEDs can be driven directly.	Input	—

(2) Non-port Pins (1/2)

Pin Name	I/O	Function	After Reset	Alternate Function
INTP0	Input	External interrupt request input for which the effective edge (rising edge, falling edge, or both rising edge and falling edge) can be specified.	Input	P00/TI0
INTP1				P01
INTP2				P02
INTP3		Falling edge detection external interrupt request input.		P03
SI0	Input	Serial interface serial data input.	Input	P25/SB0/SDA0
SI1				P20
SO0	Output	Serial interface serial data output.	Input	P26/SB1/SDA1
SO1				P21
SB0	Input/output	Serial interface serial data input/output.	Input	P25/SI0/SDA0
SB1				P26/SO0/SDA1
SDA0				P25/SI0/SB0
SDA1				P26/SO0/SB1
$\overline{\text{SCK0}}$	Input/output	Serial interface serial clock input/output.	Input	P27/SCL
$\overline{\text{SCK1}}$				P22
SCL				P27/$\overline{\text{SCK0}}$
STB	Output	Serial interface automatic transmit/receive strobe output.	Input	P23
BUSY	Input	Serial interface automatic transmit/receive busy input.	Input	P24

(2) Non-port Pins (2/2)

Pin Name	I/O	Function	After Reset	Alternate Function
TI0	Input	External count clock input to 16-bit timer (TM0).	Input	P00/INTP0
TI1		External count clock input to 8-bit timer (TM1).		P33
TI2		External count clock input to 8-bit timer (TM2).		P34
TO0	Output	16-bit timer (TM0) output (shared as 14-bit PWM output).	Input	P30
TO1		8-bit timer (TM1) output.		P31
TO2		8-bit timer (TM2) output.		P32
PCL	Output	Clock output (for main system clock, subsystem clock trimming).	Input	P35
BUZ	Output	Buzzer output.		P36
AD0 to AD7	Input/ output	Lower address/data bus for expanding memory externally.	Input	P40 to P47
A8 to A15	Output	Higher address bus for expanding memory externally.	Input	P50 to P57
$\overline{RD}$	Output	Strobe signal output for read from external memory.	Input	P64
$\overline{WR}$		Strobe signal output for writing to external memory.		P65
$\overline{WAIT}$	Input	Wait insertion at external memory access.	Input	P66
ASTB	Output	Strobe output that externally latches address information output to port 4 and port 5 to access external memory.	Input	P67
ANI0 to ANI7	Input	A/D converter analog input.	Input	P10 to P17
AV_{REF}	Input	A/D converter reference voltage input.	—	—
AV_{DD}	—	A/D converter analog power supply. Connect to V_{DD}.	—	—
AV_{SS}	—	A/D converter ground potential. Connect to V_{SS}.	—	—
$\overline{RESET}$	Input	System reset input.	—	—
X1	Input	Connecting crystal resonator for main system clock oscillation.	—	—
X2	—		—	—
XT1	Input	Connecting crystal resonator for subsystem clock oscillation.	Input	P04
XT2	—		—	—
V_{DD}	—	Positive power supply.	—	—
V_{PP}	—	High voltage applied during program write/verify. In normal operating mode, connect to V_{SS} directly.	—	—
V_{SS}	—	Ground potential.	—	—

2.2 Pins During PROM Programming Mode

Pin	I/O	Function
$\overline{\text{RESET}}$	Input	Sets PROM programming mode. When +5 V or +12.5 V is applied to the V_{PP} and low level is applied to $\overline{\text{RESET}}$ pin, microcontroller is shifted to PROM programming mode.
V_{PP}	Input	Applies high voltage during PROM programming mode setting and program write/verify.
A0 to A16	Input	Address bus
D0 to D7	Input/ output	Data bus
$\overline{\text{CE}}$	Input	PROM enable input/program pulse input.
$\overline{\text{OE}}$	Input	Read strobe input to PROM.
$\overline{\text{PGM}}$	Input	Program/program inhibit input in PROM programming mode.
V_{DD}	—	Positive power supply
V_{SS}	—	Ground potential

2.3 Pin I/O Circuits and Recommended Connection of Unused Pins

The input/output circuit type of each pin and recommended connection of unused pins are shown in Table 2-1. For the input/output circuit configuration of each type, see Figure 2-1.

3. INTERNAL MEMORY SIZE SWITCHING REGISTER (IMS)

This register is used to disable the use of part of the internal memory by software. By setting this register (IMS), it is possible to get the same memory map as that of the mask ROM versions with a different internal memory (ROM, RAM).

IMS is set with an 8-bit memory manipulate instruction.

$\overline{\text{RESET}}$ input sets IMS to CFH.

Note If external device expansion functions are to be employed for the μPD78P018FY, set the size of the internal ROM to 56 Kbytes or below using the internal memory size switching register (IMS).

Table 3-1 shows the setting values of IMS which make the memory map the same as that of the mask ROM versions.

4. INTERNAL EXPANSION RAM SIZE SWITCHING REGISTER (IXS)

This register is used to disable the use of part of the internal expansion RAM capacity by software. By setting this register (IXS), it is possible to get the same memory map as that of the mask ROM versions with a different internal expansion RAM.

IXS is set with an 8-bit memory manipulate instruction.

$\overline{\text{RESET}}$ input sets IXS to 0AH.

Note Even if a program for the μPD78P018FY in which "MOV IXS, #0CH" is written is executed in the μPD78011FY, 78012FY, 78013FY, and 78014FY, the operations are not affected.

5. PROM PROGRAMMING

The μPD78P018FY has an internal 60-Kbyte PROM as a program memory. For programming, set the PROM programming mode by setting the V_{PP} and $\overline{\text{RESET}}$ pins. For unused pin connection, refer to "**PIN CONFIGURATION (Top View) (2) PROM programming mode**."

Caution When writing in a program, use locations 0000H-EFFFH (specify the last address as EFFFH). You cannot write in using a PROM programmer that cannot specify the addresses to write.

5.1 Operating Modes

When +5 V or +12.5 V is applied to the V_{PP} pin and the low-level signal is applied to the $\overline{\text{RESET}}$ pin, the PROM programming mode is set. This mode will become the operating mode as shown in Table 5-1 when the $\overline{\text{CE}}$, $\overline{\text{OE}}$, and $\overline{\text{PGM}}$ pins are set as shown.

Further, when the read mode is set, it is possible to read the contents of the PROM.

Table 5-1. Operating Modes of PROM Programming

Pin / Operating Mode	$\overline{\text{RESET}}$	V_{PP}	V_{DD}	$\overline{\text{CE}}$	$\overline{\text{OE}}$	$\overline{\text{PGM}}$	D0 to D7
Page data latch	L	+12.5 V	+6.5 V	H	L	H	Data input
Page write				H	H	L	High-impedance
Byte write				L	H	L	Data input
Program verify				L	L	H	Data output
Program inhibit				×	H	H	High-impedance
				×	L	L	
Read		+5 V	+5 V	L	L	H	Data output
Output disable				L	H	×	High-impedance
Standby				H	×	×	High-impedance

× : L or H

(1) Read mode

Read mode is set if $\overline{CE}$ = L, $\overline{OE}$ = L is set.

(2) Output disable mode

Data output becomes high-impedance, and is in the output disable mode, if $\overline{OE}$ = H is set.

Therefore, it allows data to be read from any device by controlling the $\overline{OE}$ pin, if multiple μPD78P018FYs are connected to the data bus.

(3) Standby mode

Standby mode is set if $\overline{CE}$ = H is set.

In this mode, data outputs become high-impedance irrespective of the $\overline{OE}$ status.

(4) Page data latch mode

Page data latch mode is set if $\overline{CE}$ = H, $\overline{PGM}$ = H, $\overline{OE}$ = L are set at the beginning of page write mode.

In this mode, 1 page 4-byte data is latched in an internal address/data latch circuit.

(5) Page write mode

After 1 page 4 bytes of addresses and data are latched in the page data latch mode, a page write is executed by applying a 0.1-ms program pulse (active low) to the $\overline{PGM}$ pin with $\overline{CE}$ = H, $\overline{OE}$ = H. Then, program verification can be performed, if $\overline{CE}$ = L, $\overline{OE}$ = L are set.

If programming is not performed by a one-time program pulse, X (X ≤ 10) write and verification operations should be executed repeatedly.

(6) Byte write mode

Byte write is executed when a 0.1-ms program pulse (active low) is applied to the $\overline{PGM}$ pin with $\overline{CE}$ = L, $\overline{OE}$ = H. Then, program verification can be performed if $\overline{OE}$ = L is set.

If programming is not performed by a one-time program pulse, X (X ≤ 10) write and verification operations should be executed repeatedly.

(7) Program verify mode

Program verify mode is set if $\overline{CE}$ = L, $\overline{PGM}$ = H, $\overline{OE}$ = L are set. In this mode, check if a write operation is performed correctly, after the write.

(8) Program inhibit mode

Program inhibit mode is used when the $\overline{OE}$ pin, V_{PP} pin, and D0 to D7 pins of multiple μPD78P018FYs are connected in parallel and a write is performed to one of those devices.

When a write operation is performed, the page write mode or byte write mode described above is used. At this time, a write is not performed to a device which has the $\overline{PGM}$ pin driven high.

5.2 PROM Write Procedure

G = Start address
N = Program last address

Figure 5-2. Page Program Mode Timing

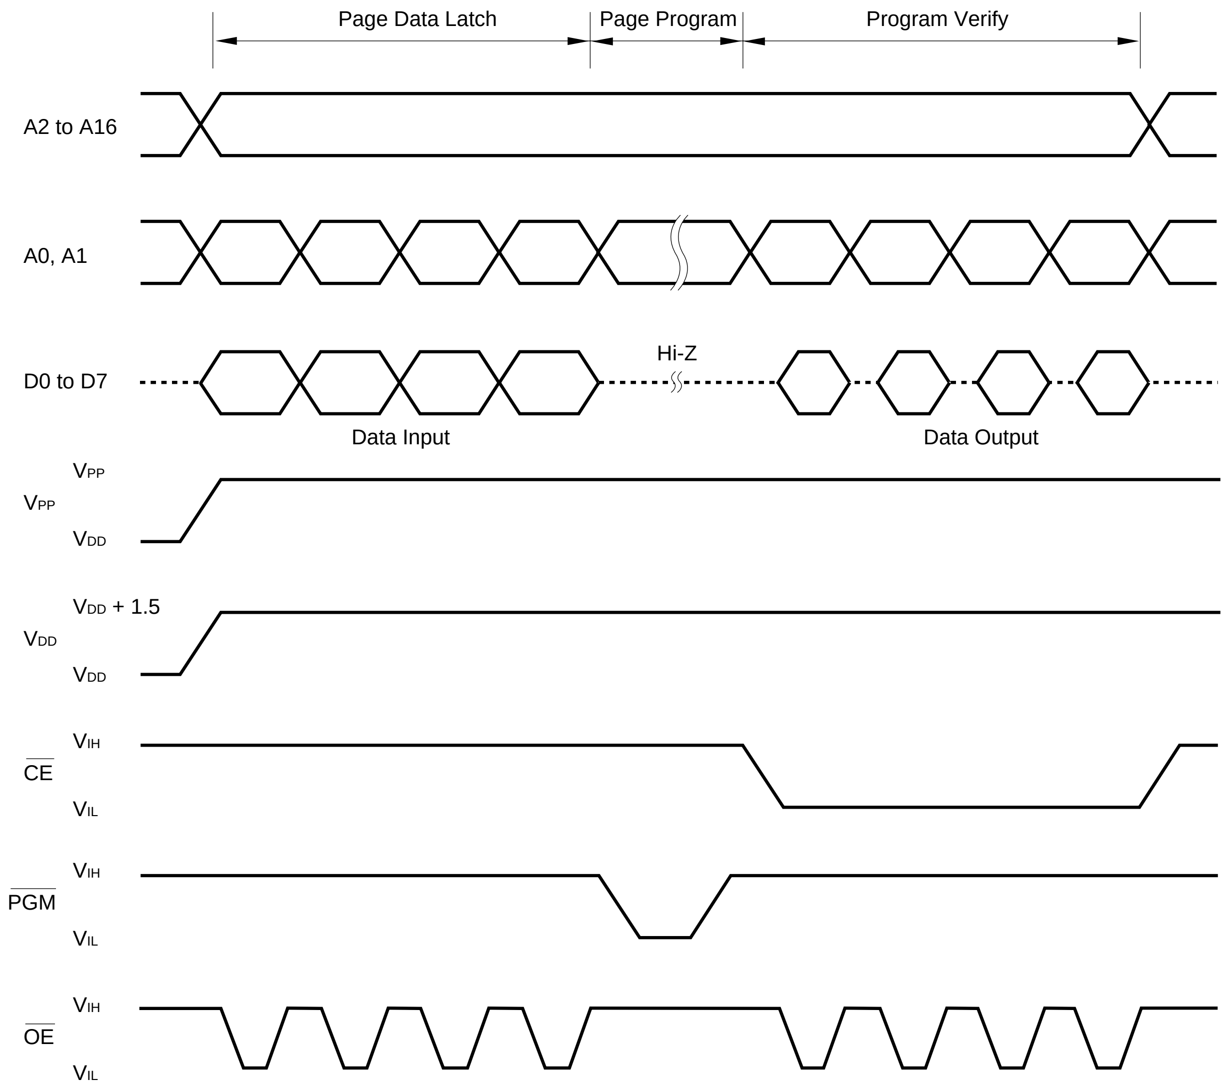

Figure 5-3. Byte Program Mode Flow Chart

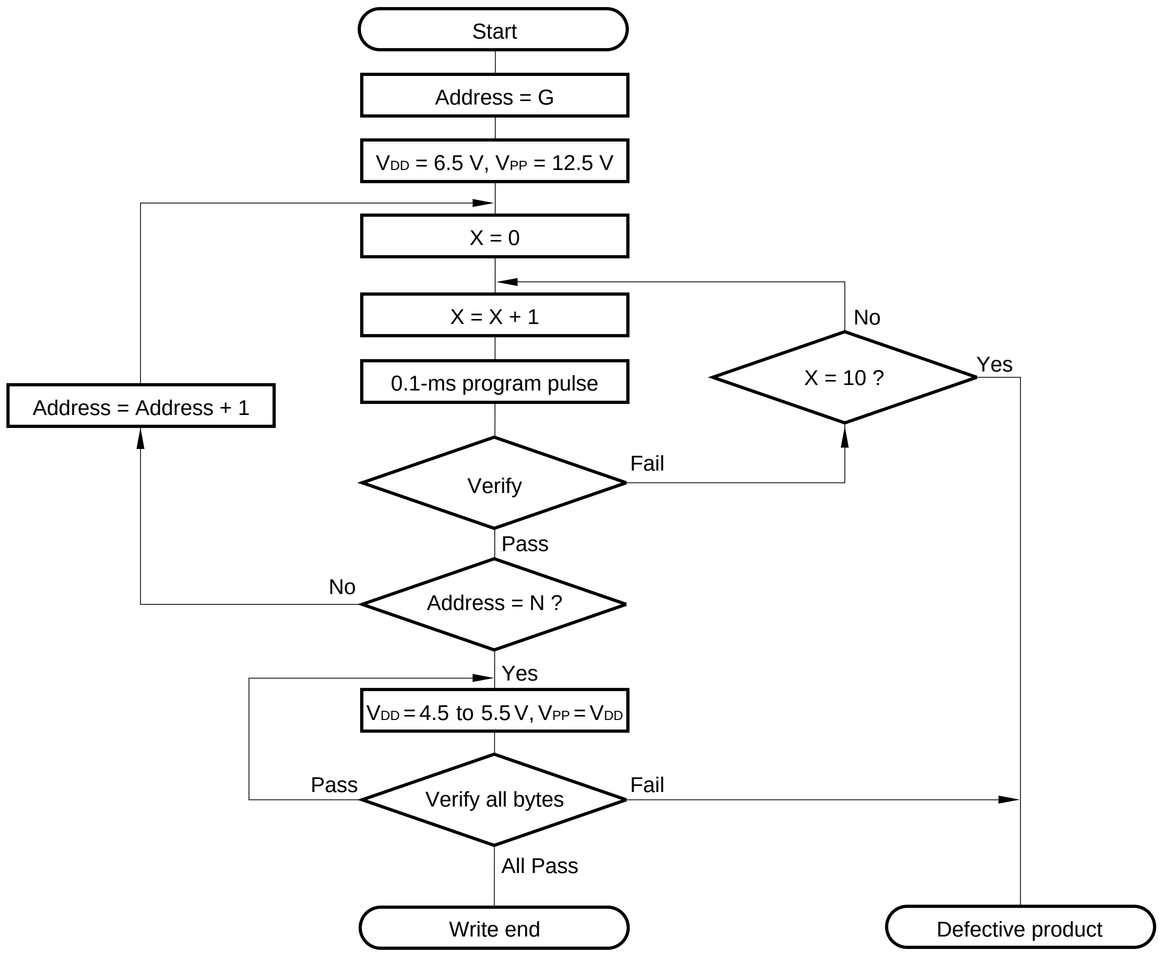
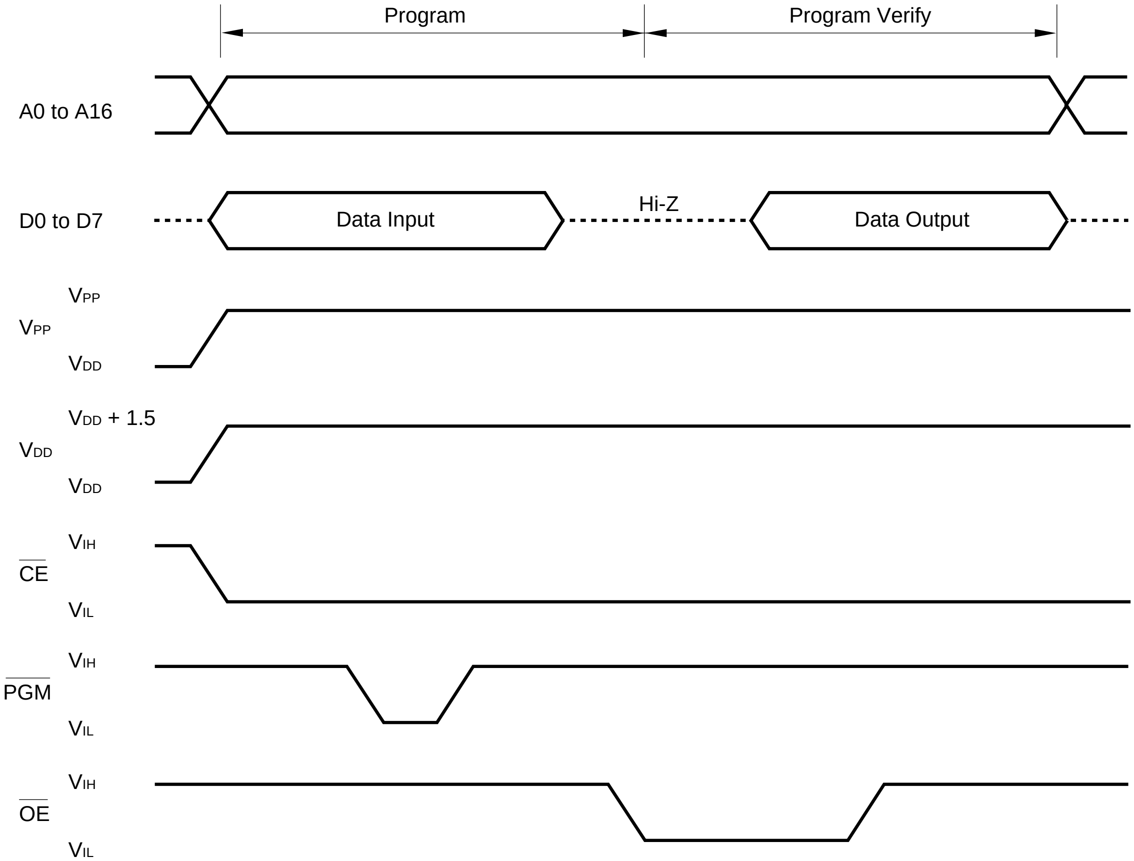


G = Start address

N = Program last address

Figure 5-4. Byte Program Mode Timing



Cautions 1. V_{DD} should be applied before V_{PP} and cut after V_{PP}.

2. V_{PP} must not exceed +13.5 V including overshoot.

3. Removing and reinserting while +12.5 V is applied to V_{PP} may adversely affect reliability.

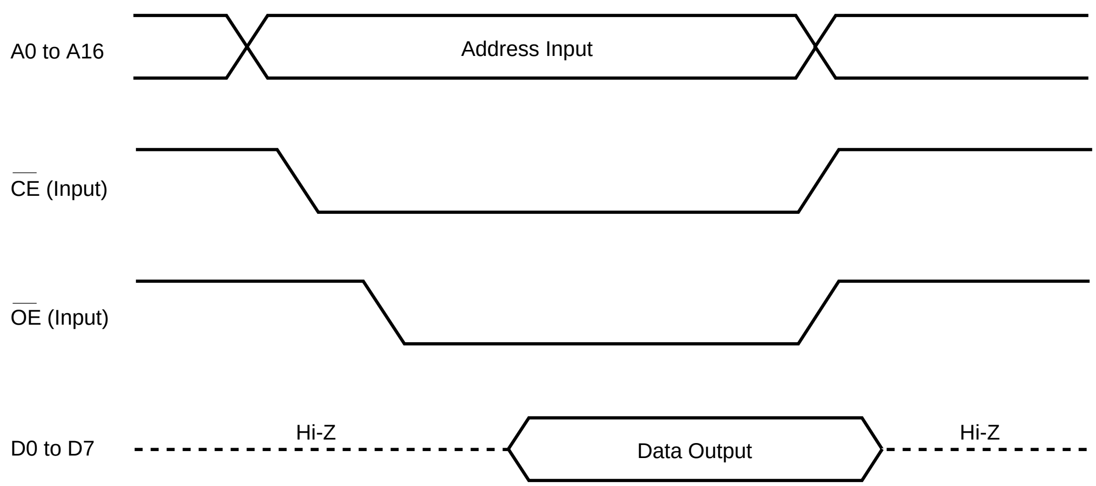
5.3 PROM Read Procedure

The contents of PROM are readable to the external data bus (D0 to D7) according to the read procedure shown below.

(1) Fix the $\overline{\text{RESET}}$ pin at low level, supply +5 V to the V_{PP} pin, and connect all other unused pins as shown in **"PIN CONFIGURATION (Top View) (2) PROM programming mode".**
(2) Supply +5 V to the V_{DD} and V_{PP} pins.
(3) Input address of read data into the A0 to A16 pins.
(4) Read mode
(5) Output data to D0 to D7 pins.

The timings of the above steps (2) to (5) are shown in Figure 5-5.

Figure 5-5. PROM Read Timings



6. PROGRAM ERASURE (FOR μPD78P018FYDW, 78P018FYKK-S)

The μPD78P018FYDW, 78P018FYKK-S are capable of erasing (FFH) the contents of data written in a program memory and rewriting.

When erasing the contents of data, irradiate light having a wavelength of less than about 400 nm to the erasure window. Normally, irradiate ultraviolet rays of 254 nm wavelength. Volume of irradiation required to completely erase the contents of data is as follows:

- UV intensity × erasing time: 30 W • s/cm^2 or more
- Erasing time: 40 min. or longer (When a UV lamp of 12 mW/cm^2 is used. However, a longer time may be needed because of deterioration in performance of the UV lamp, contamination of the erasure window, etc.)

When erasing the contents of data, set up the UV lamp within 2.5 cm from the erasing window. Further, if a filter is provided for a UV lamp, irradiate the ultraviolet rays after removing the filter.

7. OPAQUE FILM ON ERASURE WINDOW (FOR μPD78P018FYDW, 78P018FYKK-S)

To protect from unintentional erasure by rays other than that of the lamp for erasing EPROM contents, or to protect internal circuit other than EPROM from misoperating by rays, cover the erasure window with an opaque film when EPROM contents erasure is not performed.

8. ONE-TIME PROM VERSION SCREENING

The one-time PROM versions (μPD78P018FYCW, 78P018FYGC-AB8) cannot be tested completely by NEC before it is shipped, because of its structure. It is recommended to perform screening to verify PROM after writing necessary data and performing high-temperature storage under the condition below.

Storage Temperature	Storage Time
125°C	24 hours

NEC provides for a fee one-time PROM writing, marking, screening, and verify service for products designated as “QTOP Microcontrollers.” For details, contact an NEC sales representative.

Caution Product quality may suffer if the absolute maximum rating is exceed even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

		X1 input high-/low-level width (t_{XH} , t_{XL})		45		500	ns

Notes 1. Indicates only oscillator characteristics. Refer to **AC Characteristics** for instruction execution time.

2. Time required to stabilize oscillation after reset or STOP mode release.

Cautions 1. When using the main system clock oscillator, wire the area enclosed by the broken line in the above figures as follows to avoid an adverse effect from wiring capacitance.

- **Keep the wiring length as short as possible.**
- **Do not cross the wiring with the other signal lines.**
- **Do not route the wiring near a signal line through which a high fluctuating current flows.**
- **Always keep the ground point of the oscillator capacitor to the same potential as V_{SS}.**
- **Do not ground the capacitor to a ground pattern in which a high current flows.**
- **Do not fetch signals from the oscillator.**

2. When the main system clock is stopped and the system is operated by the subsystem clock, the subsystem clock should be switched again to the main system clock after the oscillation stabilization time is secured by the program.

Subsystem Clock Oscillator Characteristics (T_A = –40 to +85°C, V_{DD} = 1.8 to 5.5 V)

Resonator	Recommended Circuit	Parameter	Test Conditions	MIN.	TYP.	MAX.	Unit
Crystal resonator		Oscillation frequency (f_{XT}) Note 1		32	32.768	35	kHz
		Oscillation stabilization time Note 2	V_{DD} = 4.5 to 5.5 V		1.2	2	s

External clock		XT1 input frequency (f_{XT}) Note 1		32		100	kHz
		XT1 input high-/low-level width (t_{XTH}, t_{XTL})		5		15	μs

Notes 1. Indicates only oscillator characteristics. Refer to **AC Characteristics** for instruction execution time.

2. Time required to stabilize oscillation after V_{DD} reaches oscillator voltage MIN.

Cautions 1. When using the subsystem clock oscillator, wire the area enclosed by the broken line in the above figures as follows to avoid an adverse effect from wiring capacitance.

- **Keep the wiring length as short as possible.**
- **Do not cross the wiring with the other signal lines.**
- **Do not route the wiring near a signal line through which a high fluctuating current flows.**
- **Always keep the ground point of the oscillator capacitor to the same potential as V_{SS}.**
- **Do not ground the capacitor to a ground pattern in which a high current flows.**
- **Do not fetch signals from the oscillator.**

2. The subsystem clock oscillator is a low-amplitude circuit in order to achieve a low consumption current, and is more prone to malfunction due to noise than the main system clock oscillator.
Particular care is therefore required with the wiring method when the subsystem clock is used.

Caution The oscillator constants and oscillation voltage range indicate conditions for stable oscillation, but do not guarantee oscillation frequency accuracy. If oscillation frequency accuracy is required for actual circuits, it is necessary to adjust the oscillation frequency of the oscillator in the actual circuit. PROM Write Mode Timing (Page program mode)

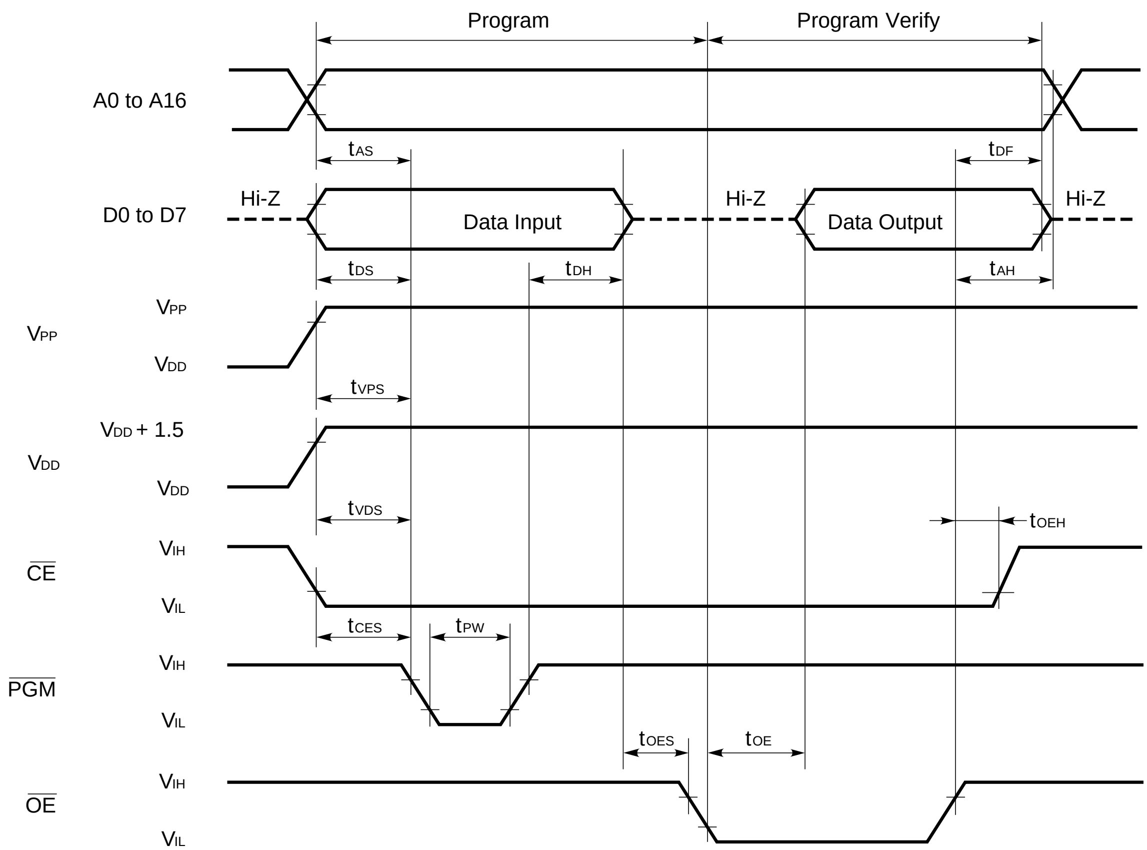
PROM Write Mode Timing (Byte program mode)

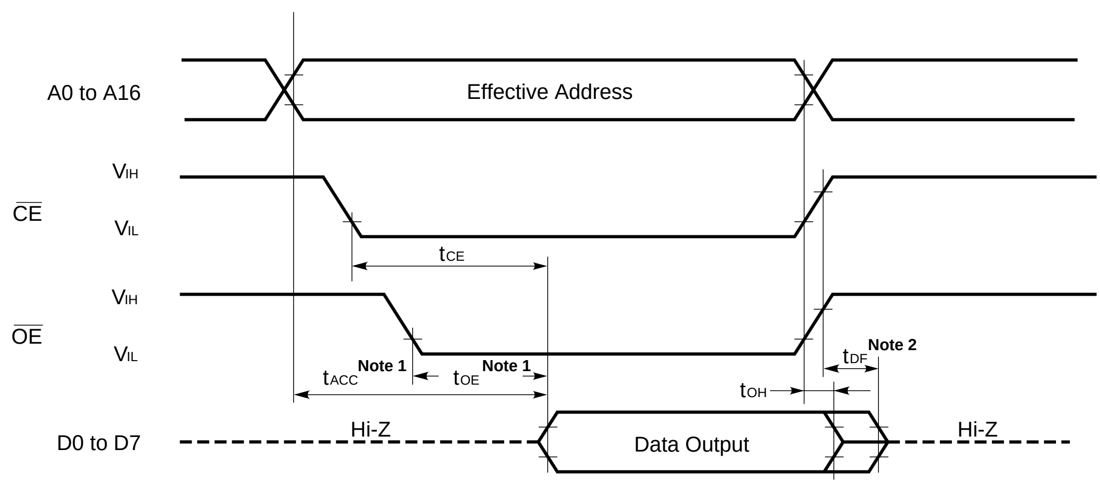


Cautions 1. V_{DD} must be applied before V_{PP} and cut off after V_{PP}.

2. V_{PP} must not exceed +13.5 V including overshoot.

3. Removing and reinserting while +12.5 V is applied to V_{PP} may adversely affect reliability.

PROM Read Mode Timing



Notes 1. When reading within the t_{ACC} range, the $\overline{OE}$ input delay time from the $\overline{CE}$ fall time must be maximum of $t_{ACC} - t_{OE}$.

2. t_{DF} is the time from the point at which either $\overline{OE}$ or $\overline{CE}$ (whichever is first) reaches V_{IH}.

12. RECOMMENDED SOLDERING CONDITIONS

The μPD78P018FY should be soldered and mounted under the following recommended conditions.

For the recommended soldering conditions, refer to the document **"Semiconductor Device Mounting Technology Manual" (C10535E)**.

For soldering methods and conditions other than those recommended below, contact your NEC sales representative.

Table 12-1. Surface Mounting Type Soldering Conditions

μPD78P018FYGC-AB8: 64-pin Plastic QFP (14 × 14 mm)

Soldering Method	Soldering Conditions	Symbol
Infrared reflow	Package peak temperature: 235°C, Time: 30 seconds Max. (at 210°C or higher), Count: Three times or less	IR35-00-3
VPS	Package peak temperature: 215°C, Time: 40 seconds Max. (at 200°C or higher), Count: Three times or less	VP15-00-3
Wave soldering	Solder bath temperature: 260°C, Time: 10 seconds Max., Count: Once, Preheating temperature: 120°C Max. (package surface temperature)	WS60-00-1
Partial heating	Pin temperature: 300°C Max., Time: 3 seconds Max. (per pin row)	—

Caution Do not use different soldering methods together (except for partial heating).

Table 12-2. Insertion Type Soldering Conditions

μPD78P018FYCW: 64-pin Plastic Shrink DIP (750 mils)
μPD78P018FYDW: 64-pin Ceramic Shrink DIP (with window) (750 mils)

Soldering Method	Soldering Conditions
Wave soldering (pin only)	Solder temperature: 260°C Max., Time: 10 seconds Max.
Partial heating	Pin temperature: 300°C Max., Time: 3 seconds Max. (per pin)

Caution Apply wave soldering only to the pins and be careful not to bring solder into direct contact with the package.

★ APPENDIX A. DEVELOPMENT TOOLS

The following development tools are available for system development using the μPD78P018FY.
Read **(5) Cautions on using developing tools** for reference.

(1) Language Processing Software

RA78K/0	Assembler package common to 78K/0 Series
CC78K/0	C compiler package common to 78K/0 Series
DF78014	Device file common to μPD78018F Subseries
CC78K/0-L	C compiler library source file common to 78K/0 Series

(2) PROM Writing Tools

PG-1500	PROM programmer
PA-78P018CW PA-78P018GC PA-78P018KK-S	Programmer adapter connected to PG-1500
PG-1500 controller	PG-1500 control program

(3) Debugging Tool

• When using in-circuit emulator IE-78K0-NS

IE-78K0-NS	In-circuit emulator common to 78K/0 Series
IE-70000-MC-PS-B	Power supply unit for IE-78K0-NS
IE-70000-98-IF-C	Interface adapter required when using PC-9800 series as host machine (excluding notebook PCs, C bus supported)
IE-70000-CD-IF-A	PC card and interface cable required when using notebook PC of PC-9800 series as host machine (PCMCIA socket supported)
IE-70000-PC-IF-C	Interface adapter when using IBM PC/AT™ compatible as host machine (ISA bus supported)
IE-70000-PCI-IF	Adapter when using PC that incorporates PCI bus as host machine
IE-78018-NS-EM1	Emulation board common to μPD78018F Subseries
NP-64CW	Emulation probe for 64-pin plastic shrink DIP (CW type)
NP-64GC	Emulation probe for 64-pin plastic QFP (GC-AB8 type)
EV-9200GC-64	Socket to be mounted on a target system board made for 64-pin plastic QFP (GC-AB8 type)

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Purchase of NEC I²C components conveys a license under the Philips I²C Patent Rights to use these components in an I²C system, provided that the system conforms to the I²C Standard Specification as defined by Philips.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.
